Dr. Peter J. Haar MD, PhD
VCU Health
Patient Presentation

- **HPI:** 32-year-old male with history of ulcerative colitis, rectal adenocarcinoma, and multiple complicated surgeries with new onset abdominal pain, distension and fever.
- **PMHx:** s/p laparotomy, J-pouch excision, revision of loop ileostomy to end ileostomy, and anal sphincter excision (approx. 2 weeks prior).
- **Medications:** acetaminophen, gabapentin, Robaxin, Zosyn, sertraline
- **Vitals:** BP 126/81, HR 118, SpO2 98% on RA, T 38.7 C
- **Relevant labs:**
  - BMP: wnl
  - CBC: WBC 18, Hgb 7.1, plt 447
What Imaging Should We Order?
ACR Appropriateness Criteria

</table>
CT Findings: Labeled

Large complex fluid collection in J-pouch excision bed consistent with large abscess

Extension into old surgical drain tracts

Dilated loops of bowel demonstrating SBO

Erosion of anterior sacrum by the complex collection

*Patient subsequently underwent CT-guided pelvic fluid collection drainage with placement of pigtail drainage catheter + IV abx.*
Final diagnosis:

Large fluid collection in the J-pouch excision bed consistent with large abscess.

*Patient returned a couple weeks later due to fever, abdominal pain/distension for which a repeat CT was completed.*
Repeat CT Findings: Unlabeled
Repeat CT Findings: Labeled

Progressive ongoing fluid collection in ileoanal pouch resection bed

Massive distension of stomach consistent with mid to distal SBO

Erosion of sacrum concerning for osteomyelitis

Extension into presacral space superiorly consistent with abscess

Placement of CT-guided drain into pelvic fluid collection
Final diagnosis:

*Recurrent* large fluid collection consistent with abscess in excision bed.
Case Discussion: What are the indications and outcomes for pouch excision?

- Ulcerative colitis (UC) procedure of choice:
  - Restorative proctocolectomy with ileal-pouch anal anastomosis (IPAA)

- Benefits:
  - Potential cure for UC
  - Improved continence and bowel function
  - Increased quality of life

- Complications:
  - Intra-abdominal/peripouch abscesses (pelvic sepsis can develop in up to 25% after IPAA most likely due to anastomotic disruption). *most common cause of pouch failure*
  - Post-op SBO (incidence between 10-25%)
  - Pouchitis: symptomatic inflammation of rectal remnant cuff (2-6% of pts with UC)
  - Reoperation/revisional surgery
  - Disease recurrence
Case Discussion cont.

• Conclusion:
  • High rate of both short and long-term postoperative complications for IPAA.
  • Appropriate counseling should be utilized to set expectations.
  • Necessitates thorough surgical decision-making and technique.
  • Early detection is key to management of post-op complications and pouch salvage.
